Abstract of the Disclosure

A receptacle, particularly a disposable brewing and drinking receptacle, comprises an outer cup, an inner cup nested within the outer cup an ingredient chamber located between mutually opposed bottom walls of the nested cups, and ports formed in the inner cup to permit flow of liquid between the ingredient chamber and the inner cup. The nested cups are coupled together by a screw thread structure which constrains the cups to move relatively to one another with a screw motion, in response to relative twisting of the cups, so that the cups are axially movable together and the bottom walls of the cups exert a squeezing action on an ingredient in the ingredient chamber in order to assist in mixing or infusing the ingredient with the liquid contained in the receptacle.
